Abstract

Útdráttur á ensku sem er að hámarki 250 orð.

Útdráttur

Hér kemur útdráttur á íslensku sem er að hámarki 250 orð. Reynið að koma útdráttum á eina blaðsíðu en ef tvær blaðsíður eru nauðsynlegar á seinni blaðsíða útdráttar að hefjast á oddatölusíðu (hægri síðu).

Preface

Formála má sleppa og skal þá fjarlægja þessa blaðsíðu. Formáli skal hefjast á oddatölu blaðsíðu og nota skal Section Break (Odd Page).

Ekki birtist blaðsíðutal á þessum fyrstu síðum ritgerðarinnar en blaðsíðurnar teljast með og hafa áhrif á blaðsíðutal sem birtist með rómverskum tölum fyrst á efnisyfirliti.

Abbreviations

Í þessum kafla mega koma fram listar yfir skammstafanir og/eða breytuheiti. Gefið kaflanum nafn við hæfi, t.d. Skammstafanir eða Breytuheiti. Þessum kafla má sleppa ef hans er ekki þörf.

The section could be titled: Glossary, Variable Names, etc.

Acknowledgments

Í þessum kafla koma fram þakkir til þeirra sem hafa styrkt rannsóknina með fjárframlögum, aðstöðu eða vinnu. T.d. styrktarsjóðir, fyrirtæki, leiðbeinendur, og aðrir aðilar sem hafa á einhvern hátt aðstoðað við gerð verkefnisins, þ.m.t. vinir og fjölskylda ef við á. Þakkir byrja á oddatölusíðu (hægri síðu).

1. Introduction

2. Preliminaries

- 2.1. Measure theory
- 2.2. Functional analysis
- 2.2.1. Hahn-Banach
- 2.2.2. Riesz representation theorem

3. Rudin-Carleson theorem

4. F. and M. Riesz theorem

A generalization of the Rudin-Carleson theorem

This borrows from Bishop (reference TODO).

Theorem 1 (General Rudin-Carleson theorem). Let X be a compact Hausdorff space, $V = (C(X), \|\cdot\|_{\infty})$, B be a closed subspace of C(X), B^{\perp} be the annihilating measures for B, S be a closed subset of X, and f be a continues function on S. If $\int_{S} f d\mu = 0$ holds for all $\mu \in B^{\perp}$ then there exists a function $F \in B$ such that F = f on S.

Proof. Since f is continuous and S is a closed subset of a compact set, and therefore also compact, f is bounded. So we can, with out loss of generality, assume that |f| < r < 1 on S. Let U_r be the subset of B defined by $U_r = \{g; ||g|| < r\}$ and ϕ be the mapping from B to C(S) that sends a member of B to its restriction on S. It suffices to show that $f \in \phi(U_r)$. Let's first show that $f \in \overline{\phi(U_r)} =: V_r$, by assuming otherwise, and showing it leads to a contradiction.

We now assume $f \notin V_r$. By Hahn-Banach (TODO ref) we can define a bounded linear functional α , such that $\alpha(f) > 1$ and $|\alpha(h)| < 1$, for $h \in V_r$. We can then define a measure μ_1 by the Riesz-representation theorem (TODO ref) that fulfills

$$\alpha(g) = \int g d\mu_1$$

for all $g \in C(S)$. We will refer to the associated functional on B by $\beta(g) = \phi(\alpha(g))$. Since $\phi(g) \in V_r$ for all $g \in U_r$ we have that

$$\beta(g) = \alpha(\phi(g)) < 1,$$

for all $g \in U_r$, due to the construction of α . From this we get

$$||\beta|| = \sup\{|\beta(g)|; |g| < 1\}$$

$$= \sup\{(1/r)|\beta(g)|; |g| < r\}$$

$$\leq \sup\{(1/r); |g| < r\}$$

$$= 1/r.$$

Let's denote the Riesz representation of β by μ_2 , set $\mu = \mu_1 - \mu_2$ and see that $\mu \in B^{\perp}$. But

$$0 = \left| \int_{S} f d\mu \right| \ge \int_{S} f d\mu_{1} - r \|\mu_{2}\| \ge \int_{S} f d\mu_{1} - r \frac{1}{r} > 1 - r \frac{1}{r} = 0,$$

where the first equality is the assumption in the theorem. This is the contradiction that gives that $f \in V_r$. We can now take a F_1 in U_r , and therefore also in B such that $|f - F_1| < \lambda/2$ on S, with $\lambda := 1 - r$. Remember that F_1 in U_r implies that $||F_1|| < r$. Now let $f_1 = f - F_1$ and use the same method as above to obtain an F_2 such that $||F_2|| < \lambda/2$ and $|f - F_2| < \lambda/4$ on S. Iterating this process yields a series $(F_n)_{n \in \mathbb{N}}$ from B that fulfill $||F_n|| < 2^{1-n}\lambda$ for n > 1 and

$$\left| f - \sum_{k=1}^{n} F_k \right| < 2^{-n} \lambda$$

on S for n > 1. We finally let

$$F = \sum_{k=1}^{\infty} F_k.$$

Now $F \in B$,

$$||F|| \le ||F_1|| + ||F - F_1|| = r + \sum_{k=2}^{\infty} 2^{1-n} \lambda = r + \lambda = 1,$$

and F = f on S. (TODO bæta við matinu, svo línan að ofan meiki sens)

Corollary 1. Let X be a compact Hausdorff space, $V = (C(X), \|\cdot\|_{\infty})$, B be a closed subspace of C(X), B^{\perp} be the annihilating measures for B, S be a closed subset of X, and f be a continues function on S. If S is B^{\perp} -null (TODO define this) then there exists a function $F \in B$ such that F = f on S.

Proof. If S is B^{\perp} -null we have that $\int_S f d\mu = 0$ for all $\mu \in B^{\perp}$ (TODO add ref to above).

Remark 1. The corollary is the version of the theorem from Bishop (TODO add ref here). Note also that if we set $X = \mathbb{T}$ and $B = \mathcal{A}$ we can use F. and M. Riesz (TODO add ref here) to prove the classical Rudin-Carleson theorem (TODO add ref here).

It is of course worth noting an applications of (TODO REF to theorem) where the corollary fails.

Example 1. Let $X = \mathbb{T}$, $B = \mathcal{A}$ (TODO define this), E be a closed m-null (TODO define this, an maybe change to m_{σ}) subset of $\partial \mathbb{T}$ that is not dense in E, $F = \{e^{i\theta}; a \leq \theta \leq b\}$, and choose e and such that e and e are disjoint and e e b. The last assumption restricts us to e that are not dense in the e. Since e e b we obtain that e in e e b e does not fulfill the requirements of the Rudin-Carelson theorem (TODO add ref here) nor the above corollary (TODO add ref). Let's choose e such that e 0 on e and e is continues on e in e we now have for all e e e

$$\left| \int_{S} f d\mu \right| = \left| \int_{E} f d\mu + \int_{F} f d\mu \right|$$

$$\leq \left| \int_{E} f d\mu \right| + \left| \int_{F} f d\mu \right|$$

$$= 0 + \left| \int_{F} f d\mu \right|$$

$$= 0$$

The F. and M. Riesz theorem (TODO add ref here) tells us the since E is m-null it is also μ -null, which gives the third step. The final step stems from the fact that f vanishes on F. We now see the X, B, and f are all as in theorem (TODO add ref) so there exists a $F \in B$, such that F = f on S.

A. Annað
